Claims

What is claimed is:

- A system that test loads a server comprising:
 a dynamic load adjustor component that dynamically adjusts user characteristics,
 for distribution thereof as a percentage of total requests sent to a server being load tested.
- 2. The system of claim 1 further comprising a profile characteristic data store that supplies the dynamic load adjustor component with weighting for a characteristic defined in a user profile.
- 3. The system of claim 2, the dynamic load adjustor component further comprises a weighting designator that randomly assigns to users characteristics based on weightings defined in the user profile.
- 4. The system of claim 2, the characteristic is at least one of: network connections, browser types, and load patterns.
- 5. The system of claim 2, the characteristic is statistically determined based on web log records.
- 6. The system of claim 2, the characteristic is predetermined in a single user profile.
- 7. The system of claim 1, further comprising a load coordinator component that adjusts an intensity of a load test based on a current distribution of users entering and leaving the server relative to a desired test load.
- 8. The system of claim 1, further comprising an artificial intelligence component.
- 9. The system of claim 1 further comprising a closed loop control to enable a continual and sustained rate of requests to the server.

10. A system that stresses a server, comprising:

an execution engine that generates a scenario that loads the server via a plurality of users, the plurality of users is dynamically adjusted based on predetermined weightings of a user profile having weighted characteristics therein, wherein the scenario distributes user characteristics as a percentage of total requests.

- 11. The system of claim 10, the scenario comprises at least one of a test mix and a load profile.
- 12. The system of claim 10 further comprising a control input that adjusts rate of requests loaded onto the server.
- 13. The system of claim 10 further comprising a queuing mechanism that retrieves and sorts requests to be sent to the server.
- 14. The system of claim 10 further comprising a scheduler that determines number of requests to be generated for an upcoming period.
- 15. The system of claim 10 the requests are sorted according to a time function for execution.
- 16. A method for load testing a server comprising: assigning weights to user characteristics in a user profile; dynamically adjusting the user characteristics during the testing of the server; and distributing the user characteristics as a percentage of total requests sent to the server.

- 17. The method of claim 16 further comprising comparing a current load on the server with a desired load.
- 18. The method of claim 17 further comprising creating a new user if the current load is less than a desired load.
- 19. The method of claim 17 further comprising reducing the current load by one upon ending an iteration, if the current load is not less than the desired load.
- 20. The method of claim 16 further comprising controlling a rate of loading *via* a feedback loop control.
- 21. A system for test loading a server comprising: means for dynamically adjusting user characteristics while loading the server; and means for distributing the user characteristics as a percentage of total requests sent to the server.
